ACKNOWLEDGEMENTS

The following individuals and their respective companies and organizations assisted with providing the technical and operational information described in this report, or by facilitating the process to obtain this information. We truly appreciate their time, effort, expertise, and cooperation. The Port of Long Beach and Starcrest Consulting Group, LLC (Starcrest) would like to recognize and thank the following individuals:

Stephen Shahnazarian, American Marine
Milt Merritt, Amnav
Shawn Bennett, Bay Delta Maritime
Greg Bombard, Catalina Express
Rich Pruitt, Carnival Cruise Lines
David Scott, Connolly-Pacific
Javier Montano, Starlight Marine
Jason Knowlton, Foss
Halfdan Ross, International Transportation Service (ITS)
Stephanie MacPhee, ITS
Captain Thomas Jacobsen, Jacobsen Pilot Service
Jeff Podgorski, Long Beach Container Terminal
Rob McIntosh, Marine Aggregate Terminal
Joe Lockhart, Metro Cruise Services
Robert Waterman, Metropolitan Stevedore (Metro Ports)
Otis Cliatt, Pacific Harbor Line
Greg Peters, Pacific Harbor Line
Porter Travis, PCMC
Grant Westmoreland, Pacific Tugboat Service
Allie Bond, SA Recycling
Emile Shiff, Sause Brothers
Matt Sullivan, SSA
Justin French, Total Terminals International (TTI)
Verowin Hunting, TTI
Naomi Torres, Toyota
Rakshita Dissanayake, Weyerhaueser

ACKNOWLEDGEMENTS (CONT'D)

The Port of Long Beach and Starcrest would like to thank the following reviewers who contributed, commented, and coordinated the approach and reporting of the emissions inventory:

Cory Parmer, California Air Resources Board
Nancy Bui, California Air Resources Board
Brian Choe, South Coast Air Quality Management District
Sang Mi Li, South Coast Air Quality Management District
Elaine Shen, South Coast Air Quality Management District
Francisco Dóñez, U.S. Environmental Protection Agency

Starcrest would like to thank the following Port of Long Beach staff members for assistance during the development of the emissions inventory:

Morgan Caswell, Project Manager
Heather Tomley
Matthew Arms

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

Please note that there may be minor inconsistencies, due to rounding, associated with emission estimates, percent contribution, and other calculated numbers between the various sections, tables, and figures of this report. Estimates are calculated using more significant figures than presented in the various tables. A detailed San Pedro Bay Ports Emissions Inventory Methodology Report is available on the Port's website[1]. This 2022 Air Emission Inventory correlates with Version 4 of the Methodology Report.

EXECUTIVE SUMMARY

In 2022, the Port of Long Beach reported 9.1 million twenty-foot equivalent units (TEUs), the second busiest year in the Port's history after the 2021 record cargo volume of 9.4 million TEUs. The Port continued to experience some congestion in early 2022 with vessels waiting for berth availability. The Port and marine terminal operations were able to return to normal operations as cargo volumes softened in the second half of the year. This resulted in overall lower vessel emissions in 2022 as compared to 2021. In 2022, emissions for the other source categories are slightly lower than the previous year, tracking with the slight decrease in throughput compared with 2021.

Emissions Comparison to Previous Year

Containerized cargo throughput is 3% lower in 2022 than 2021. The average TEU per call and containership calls are similar as the previous year (-1%).

Table ES.1: 2021-2022 Container Throughput and Vessel Call Comparison

Year	Container Throughput (TEU)	All Arrivals	Containership Arrivals	Average TEU per Call
2021	9,384,368	1,905	912	10,290
2022	9,133,657	2,068	901	10,137
Change (%)	**-3%**	**9%**	**-1%**	**-1%**

Table ES.2 compares the 2022 emissions to the previous year which shows emissions are lower across the board. The 2021 emissions for OGV do not match the emissions included in the previous 2021 EI report because they are updated with revised auxiliary load for vessels at anchorage due to drifting that occurred in 2021.

Highlights for 2022 as compared to the previous year are:

- ✓ Vessel counts at anchorage were 24% lower and shifts were 29% lower in 2022 which resulted in lower ocean-going vessels (OGV) emissions compared to previous year. Containerships and cruise ships anchorage visits were 76% and 92% lower in 2022, respectively.
- ✓ Truck calls for 2014 model year and newer increased to 64% in 2022 as compared to 48% in 2021 which resulted in lower NO_x and PM emissions for trucks.

[1] *www.polb.com/environment/air/#emissions-inventory*

- ✓ Increase in Tier 4 engines for harbor craft since 2021 (24 vs 10 Tier 4 engines).
- ✓ Most of the container terminals switched to using renewable diesel for the equipment in 2022 which lowers cargo handling equipment (CHE) CO_2 emissions. Only tailpipe emissions reductions are accounted for in this inventory.
- ✓ Lower TEU cargo throughput resulted in lower activity which results in lower emissions for all source categories in 2022 as compared to previous year.

Table ES.2: 2021-2022 Air Emissions Comparison by Source Category

	PM_{10} tons	$PM_{2.5}$ tons	DPM tons	NO_x tons	SO_x tons	CO tons	HC tons	CO_2e MT

Emissions Comparison to Baseline Year

The Port of Long Beach 2022 Air Emissions Inventory results and a comparison to the Port's baseline 2005 air emissions inventory are presented in Table ES.3. Overall, criteria pollutant emissions are significantly lower when comparing 2022 to 2005.

Table ES.3: 2005-2022 Air Emissions Comparison by Source Category

	PM_{10} tons	$PM_{2.5}$ tons	DPM tons	NO_x tons	SO_x tons	CO tons	HC tons	CO_2e MT
2005								
Ocean-going vessels	866	693	595	6,655	6,848	531	234	386,935

Table ES.4 summarizes and compares vessel arrivals and containerized TEU at POLB in 2005 and 2022. Relative to 2005 levels, containerized cargo throughput is up 36%, while containership arrivals to POLB are down 32%. Indicative of the larger vessels calling at POLB, the average number of TEU per vessel call doubled in 2022 as compared to 2005 with an average 10,137 TEU per containership call.

Table ES.4: 2005-2022 Container Throughput and Vessel Call Comparison

	Container Throughput (TEU)	All Arrivals	Containership Arrivals	Average TEU per Call
2005	6,709,818	2,617	1,332	5,037
2022	9,133,657	2,068	901	10,137
Change (%)	**36%**	**-21%**	**-32%**	**101%**

The criteria pollutant reductions over the last 17 years continued to be significant despite a 36% increase in TEU throughput in 2022 as compared to 2005. Several factors contributed to the lower emissions between 2005 and 2022:

- For OGVs, the primary reasons for emission reductions are fuel switching, shore power, fewer vessel calls, newer vessels, high participation in the Port's Green Flag Program that incentivizes shipping lines to slow down within 20 and 40 nautical miles, introduction of LNG fuel used by vessels, and the Green Ship Program, which incentivizes higher tier vessels and includes Environmental Ship Index (ESI) NO_x values. In 2022, 5% of the vessel calls had engines meeting the Tier III NO_x emission standard which is 75% cleaner than the Tier II engine standard. The fewer vessel calls and use of shore power at berth had a positive impact on CO_2e emissions with no significant increase in CO_2e emissions in 2022 as compared to 2005 despite of 36% increase in container throughput.

- For harbor craft, the emissions in 2022 are lower than 2005 emissions due to the repowers that have occurred as required by the original CARB Commercial Harbor Craft Regulation (prior to amendments which became effective in 2023), funding incentives, removal of older vessels due to attrition, and more efficient operations. In 2022, there are 24 Tier 4 engines in the inventory compared to 10 Tier 4 engines in 2021. There are no CO_2 standards for engines or control measures for harbor craft, therefore, the CO_2e emissions change along with activity trend.

- For CHE, implementation of CAAP measures requiring equipment to meet Tier 4 engine standards through leases, CARB's Cargo Handling Equipment Regulation that also phased in Tier 4 CHE, along with funding incentives, resulted in replacement of older equipment with cleaner units, retrofits, and repowers. Replacement of older equipment combined with improved efficiency in operations led to lower emissions. The increase in CO emissions from cargo handling equipment is attributed to increased usage of several gasoline-fueled equipment with higher CO emission rates compared to diesel equipment. The increase in CO_2e reflects increased activity and the fact that there are no lower CO_2 emission standards

and limited emission control measures available. In 2022, more terminal operators started and/or continue using renewable diesel which has a lower carbon intensity than conventional diesel when taking into consideration life cycle analysis. In this report, only tailpipe emissions reductions from renewable diesel use are accounted in the GHG emissions results.

- For locomotives, the decreases in fleet-wide emissions from line haul locomotives are due to rail companies meeting the terms of the memorandum of understanding (MOU) with CARB that resulted in Tier 2 locomotive fleet average emissions by 2010, and the replacement of older switching locomotives with new low-emission and ultra-low emission switchers.

- For HDV, all new trucks that register in the Ports' Drayage Truck Registry are required to be 2014 model year or newer. The share of mileage driven by 2014 and newer model year trucks increased to 64% in 2022 which results in NO_x and PM reductions due to the cleanest engine standards being used by the majority of the drayage trucks. In the past, the 2012 implementation of the final phase of the Port's Clean Truck Program (CTP) and substantial funding awarded towards truck replacement resulted in significant turnover of older trucks to newer and cleaner trucks as compared to 2005.

In 2022, anchorage calls are 24% lower compared to 2021, especially for containerships and cruise ships which saw a significant decrease of vessels at anchorage. As a result of the lower anchorage calls, there were also fewer shifts (-29%) in 2022 as compared to 2021.

Table ES.5: 2022-2021 Anchorage Calls Comparison

Vessel Type	2021 Anchorage	2022 Anchorage	2021-2022 Change
Containership	704	167	-76%
Tanker	561	690	23%
Cruise	12	1	-92%
Bulk Carrier	194	246	27%
Auto Carrier/RoRo	10	8	-20%
General cargo	20	26	30%
Total	**1,501**	**1,138**	**-24%**

Emissions Metrics

To track operational efficiency improvements and the effectiveness of the emissions reduction strategies and measures, emissions are also estimated in total emissions per unit of cargo handled through the Port. Table ES.6 compares the tons of emissions per 10,000 TEU in 2005, 2021, and 2022.

Table ES.6: Emissions Efficiency Metric Comparison, tons per 10,000 TEU

Year	PM_{10}	$PM_{2.5}$	DPM	NO_x	SO_x	CO	HC	CO_2e
2005	1.76	1.48	1.36	22.45	10.40	4.20	1.11	1,457
2021	0.18	0.17	0.12	8.19	0.27	2.30	0.38	1,224
2022	0.14	0.13	0.09	6.06	0.21	2.19	0.29	1,058
CAAP Progress	**-92%**	**-92%**	**-93%**	**-73%**	**-98%**	**-48%**	**-74%**	**-27%**
Previous Year	**-25%**	**-25%**	**-26%**	**-26%**	**-22%**	**-4%**	**-23%**	**-13%**

Progress Towards CAAP Goals

Tables ES.7 and ES.8 summarize the air emissions reductions of DPM, NO_x, and SO_x associated with good movement sources and compared to the established CAAP San Pedro Bay (SPB) Emissions Reduction Standards for 2014 and 2023 from the baseline year 2005.

As a result of the implementation of CAAP measures and regulations, 2022 emission reduction levels of DPM, NO_x and SO_x surpassed the 2023 SPB Emission Reduction Standards.

Table ES.7: 2022 Emissions Reductions Compared to San Pedro Bay CAAP

Pollutant	2022 Actual Reductions	2023 Emission Reduction Standard
DPM	91%	77%
NO_x	63%	59%
SO_x	97%	93%

Table ES.8: 2005-2022 Emissions Reductions Compared to San Pedro Bay CAAP by Source Category

Category	2005		2022

CAAP San Pedro Bay SO_x Emissions Reduction Standards		**2023**	**93%**

SECTION 1 INTRODUCTION

The Port of Long Beach (Port or POLB) annual activity-based emissions inventories serve as the primary tool to track the Port's efforts to reduce air emissions from goods movement-related sources through implementation of measures identified in the San Pedro Bay Ports Clean Air Action Plan (CAAP) and regulations promulgated at the state and federal levels. To quantify the annual air emissions, the Port relies on operational information provided by Port tenants and operators. Development of the annual air emissions estimates is coordinated with a technical working group (TWG) comprised of representatives from the Port, the Port of Los Angeles, and the following air regulatory agencies: U.S. Environmental Protection Agency, Region 9 (EPA), California Air Resources Board (CARB), and the South Coast Air Quality Management District (South Coast AQMD). Emissions estimated in this report are consistent with CARB and U.S. EPA published methodologies. As additional data is gathered, the Port plans to collaborate with TWG to update alternative fuel emission factors, reductions associated with the use of renewable diesel, and OGV emission changes with engine load, if deemed appropriate.

Emissions from the following goods movement-related emission source categories are evaluated:

- Ocean-going vessels (OGV)
- Harbor craft
- Cargo handling equipment (CHE)
- Rail locomotives
- Heavy-duty vehicles (HDV)

Exhaust emissions of the following pollutants, including greenhouse gases, are quantified in the inventory:

- Particulate matter (PM) (10-micron, 2.5-micron)
- Diesel particulate matter (DPM)
- Oxides of nitrogen (NO_x)
- Oxides of sulfur (SO_x)
- Hydrocarbons (HC)
- Carbon monoxide (CO)
- Carbon dioxide equivalent (CO_2e)

Greenhouse gas (GHG) emissions are presented in units of metric tons (MT) of carbon dioxide equivalents, which weight each gas by its global warming potential (GWP) value relative to CO_2. To normalize these values into a single greenhouse gas value, CO_2e, the GHG emission estimates are multiplied by the following values and summed.[2]

- CO_2 – 1
- CH_4 – 25
- N_2O - 298

Geographical Domain

Figure 1.1 shows the Port of Long Beach emissions inventory domain. For rail locomotives and on-road trucks, emissions are estimated from the Port to the cargo's first point of rest within the SoCAB or up to the basin boundary, whichever comes first.

For OGV and harbor craft, the domain includes berths and waterways in the Port proper and all vessel movements within the 40-nautical mile (nm) arc from Point Fermin. The northern boundary is the Ventura County line, and the southern boundary is the Orange County line. It should be noted that although the overwater boundary for the South Coast air quality modeling domain extends further off the coast, most of the vessel movements occur within the 40 nm arc. Vessels that pass through the domain, but do not call on the Port are excluded from the inventory.

[2]U.S. EPA, *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2019*, EPA 430-R-21-005, published 2021.

The Hawaiian, western and southern routes extend beyond the 40 nm arc into the outer part of the South Coast air quality modeling domain. For the western and southern routes, this emissions inventory covers the majority of the emissions as most of the vessel movements occur within the 40-nm arc. For the Hawaiian route, this emissions inventory domain includes the additional SoCAB over-water boundary emissions that extends past the 40 nm mile arc.

Figure 1.1: Port of Long Beach Emissions Inventory Domain

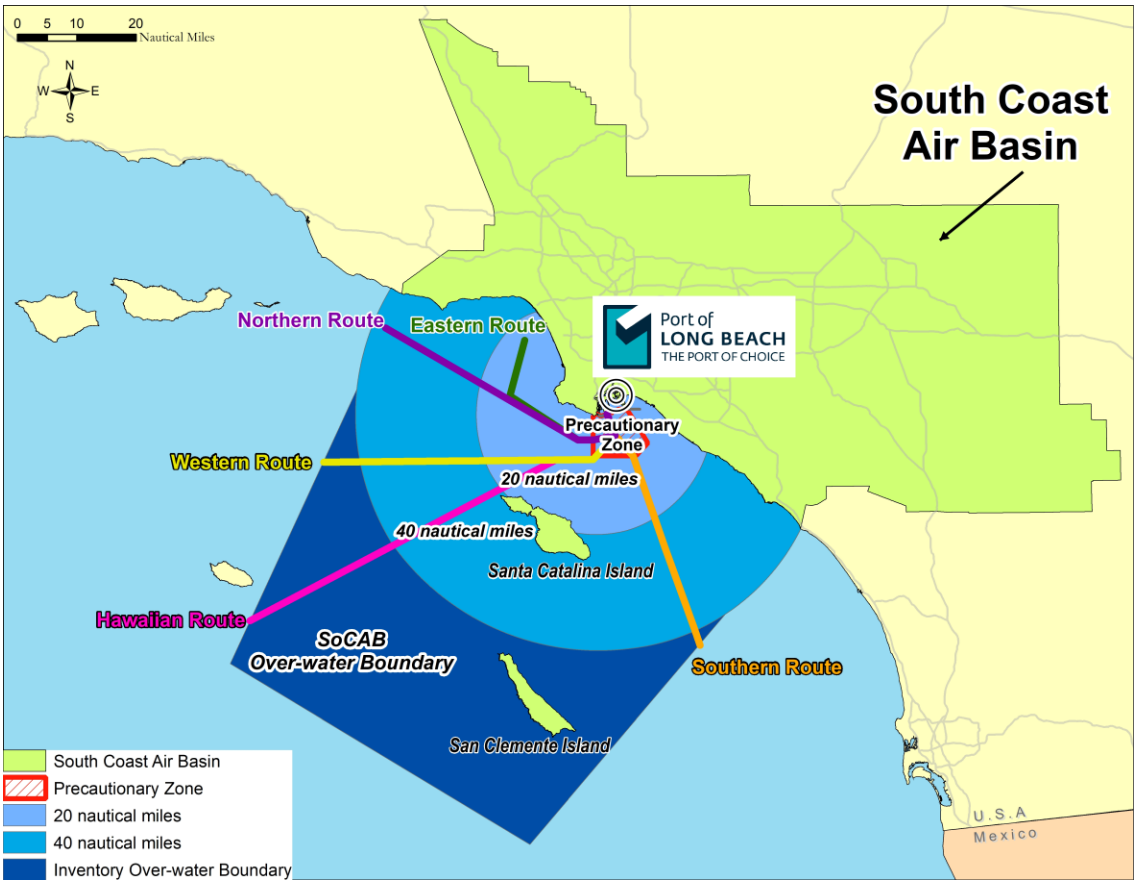

Figure 1.2 shows the location of the anchorage areas for San Pedro Bay Ports. The orange shading shows the POLB terminals. The green areas are the known anchorage areas. Vessel emissions at anchorage are included in the air emissions inventory report as part of the OGV emissions. The Precautionary Area, labeled as precautionary zone, is an area where ships must navigate with particular caution. The northern and southern shipping lanes in the USCG include a Separation Zone to separate opposing traffic lanes by 1 to 2 miles within each sector.

Figure 1.2: Anchorage Areas

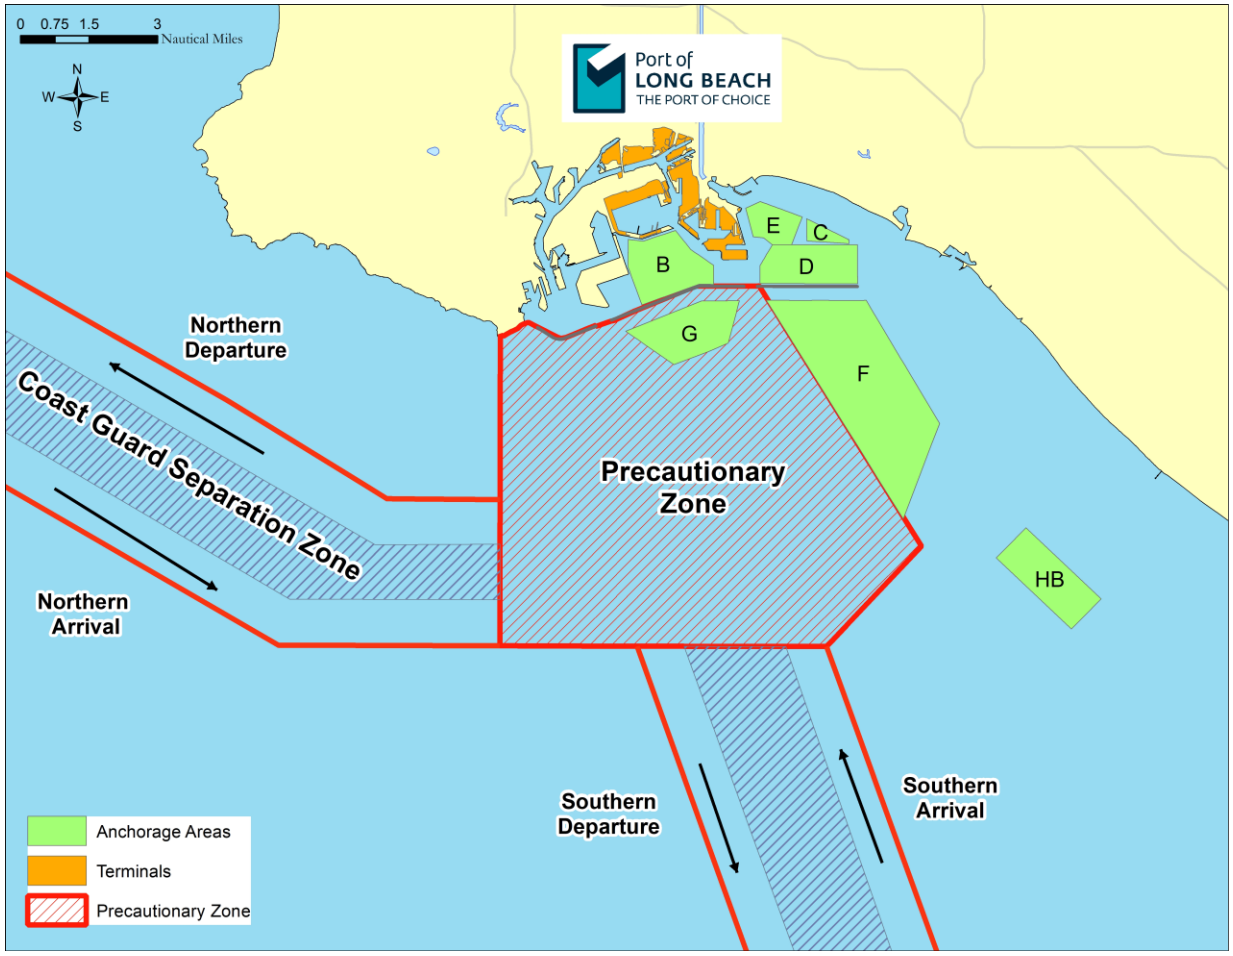

Figure 1.3 shows the land area of active Port terminals in 2022. The geographical domain for cargo handling equipment is the terminals and facilities on which they operate.

Figure 1.3: Port of Long Beach Terminals

SECTION 2 OCEAN-GOING VESSELS

Source Description

Vessels are grouped by the type of cargo they transport:

- Auto carrier
- Bulk carrier
- Containership
- Cruise vessel
- General cargo
- Reefer vessel
- Roll-on roll-off vessel (RoRo)
- Tanker

Emissions are estimated from vessel main engines (propulsion), auxiliary engines, and auxiliary boilers (boilers). For 2022, containerships and tankers continued to be the predominant vessels with 69% of total movements.

Emissions Estimation Methodology

The methodology to estimate 2022 emissions from OGVs is described in Section 2 of the San Pedro Bay Ports Emissions Inventory Methodology Report Version 4. The following improvements were made in estimating 2022 OGV emissions:

- Added LNG emission factors for vessels that switched to LNG fuel while at the Port.
- Updated auxiliary engine and auxiliary boiler default loads using the Port's Vessel Boarding Program (VBP) data collected since the completion of the 2021 EI.

Table 2.1 lists the emission factors for engines and steam boilers using LNG fuel per EPA's Ports EI Guidance for most pollutants and IMO 4th GHG report for SO_x emission factor. In 2022, there were 4 vessels (25 arrivals) that used LNG fuel.

Table 2.1: Emission Factors for Engines and Steam Boilers using LNG fuel, g/kWh

Engine Category	IMO Tier	Year	PM_{10}	$PM_{2.5}$	DPM	NO_x	SOx	CO	HC	CO_2	N_2O	CH_4
Propulsion engines	All	All	0.03	0.028	0.00	1.30	0.005	1.3	0.00	456.50	0.029	0.00
Auxiliary engines	All	All	0.03	0.028	0.00	1.30	0.005	1.3	0.00	456.50	0.029	0.00
Steam boilers	na	na	0.03	0.028	0.00	1.30	0.005	1.3	0.00	456.50	0.029	0.00

Tables 2.2 through 2.4 list the emission factors for propulsion engines, auxiliary boilers, and auxiliary engines using 0.1% sulfur marine gas oil (MGO) fuel, respectively. The emission factors are per EPA's Ports Emissions Inventory Guidance: Methodologies for Estimating Port-Related and Goods Movement Mobile Source Emissions (September 2020)[3].

Table 2.2: OGV Emission Factors for Propulsion Engines using 0.1% S, g/kWh

Engine Category	Tier	Model Year Range	PM_{10}	$PM_{2.5}$	DPM	NO_x	SOx	CO	HC	CO_2	N_2O	CH_4

Geographical Domain

The geographical domain or overwater boundary for OGVs includes the berths and waterways in the Port proper as shown in Figure 1.2 and all vessel movements within the forty nautical mile (nm) arc from Point Fermin and the SoCAB as shown in Figure 1.1. The northern boundary is the Ventura County line, and the southern boundary is the Orange County line. It should be noted that although the overwater boundary for the South Coast air quality modeling domain extends further off the coast, most of the vessel movements occur within the 40 nm arc. Vessels that pass through the domain, but do not call the Port are excluded from the inventory.

The Hawaiian, western and southern routes extend beyond the 40 nm arc into outer part of the South Coast air quality modeling domain. For the western and southern routes, this emissions inventory covers most of the emissions as most of the vessel movements occur within the 40-nm arc. For the Hawaiian route, this emissions inventory includes the other SoCAB over-water boundary emissions that extends past the 40 nm mile arc.

Data and Information Acquisition

The primary sources of data and operational information for OGV were obtained from:

- Marine Exchange of Southern California
- Vessel Speed Reduction Program
- Jacobsen Pilot Service
- IHS Markit Maritime data
- Port Vessel Boarding Program (VBP)
- Port of Long Beach tanker loading information
- Terminal shore power activity data, including usage of CARB-approved emission control systems (CAECS) that treat emissions from auxiliary engines on ocean going vessels.

Emission Estimates

Summaries of the 2022 OGV emissions estimates are presented in Tables 2.5 through 2.7.

Operational Profiles

Table 2.8 presents the numbers of arrivals, departures, and shifts associated with vessels at the Port in 2022. An arrival is a vessel that arrives from the sea to a berth or to anchorage prior to shifting to a berth.

Table 2.8: 2022 Total OGV Activities

Auxiliary engines are used to provide electricity to equipment onboard the vessel. Actual VBP data, if available, is used to estimate emissions from auxiliary engines. For berth hotelling emissions, the actual shore power records are used if the vessel connected to shore power. If actual VBP data or shore power data is not available, call-weighted average of VBP data points are used as defaults. Table 2.9 presents the auxiliary engine load defaults by vessel type and by mode.

Table 2.9: 2022 Average Auxiliary Load Defaults by Mode, kW

Tankers use boilers to produce steam for equipment such as cargo pumps and steam powered inert gas fans, and also to heat fuel for pumping. Less steam is required when liquid cargo is being loaded because the steam-powered cargo pumps are not needed during loading operations. Since loading and discharging data was available for the tankers that visited the Port, a lower boiler load of 875 kW was used for tankers known to be loading cargo while at berth, while the higher boiler load listed in the table was used as a default for the tanker calls that were discharging cargo.

The default loads do not include loads from diesel electric tankers. Diesel electric crude oil tankers have significant auxiliary equipment/load differences than typical motor vessels. Specific auxiliary engine loads, collected from VBP, are used for diesel electric tankers for both the auxiliary engine and auxiliary boilers.

Table 2.11 lists the auxiliary engine defaults for all cruise ships (diesel electric and non-diesel electric) engaged in passenger service at the Port in 2022. These auxiliary engine defaults values are produced by calculating the call-weighted average of VBP data by mode of operation for each cruise vessel size group up to 4,000 passengers. For vessels larger than 4,000 passengers, the defaults were scaled up to reflect the operations of larger size vessels. Normal cruise ship operations were underway for the full 2022 calendar year.

Table 2.11: Cruise Ship Average Auxiliary Engine Load Defaults, kW

Passenger Range	Transit	Maneuvering	Berth Hotelling	Anchorage Hotelling
<1,500	3,994	5,268	3,069	2,289
1,500 < 2,000	7,000	9,000	5,613	na
2,000 < 2,500	11,000	11,350	6,900	na
2,500 < 3,000	9,781	8,309	6,089	5,916
3,000 < 3,500	8,292	10,369	8,292	7,475
3,500 < 4,000	9,945	11,411	10,445	10,191
4,000 < 4,500	12,500	14,000	12,000	9,900
4,500 < 5,000	13,000	14,500	13,000	na

Table 2.12 presents the load defaults for the auxiliary boilers for diesel electric cruise ships. The default averages presented are an operational average, meaning they factor in if a vessel reported that they do not use their auxiliary boiler in a certain mode. In 2022, all of the cruise vessels that visited the Port were diesel electric.

Table 2.12: Cruise Ship Auxiliary Boiler Load Defaults by Mode for, kW

Passenger Range	Transit	Maneuvering	Berth Hotelling	Anchorage Hotelling
<1,500	992	784	867	766

Table 2.16 presents the percent of engine tier by vessel type for arrivals/shift at the Port in 2022. In 2022, 5% of the calls were from vessels with certified Tier III main engines. NO_x emissions for Tier III vessels are 75% cleaner than Tier II vessels when operating at or above 25% main engine load. The no tier column includes steamships or vessels with gas turbines.

SECTION 3 HARBOR CRAFT

Source Description

Harbor craft are commercial vessels that spend the majority of their time within or near the port and harbor, except for articulated tug barges (ATBs) which transit from port to port and may not be home berthed at the Port. Since the 2021 EI, ATBs are included in the harbor craft inventory to be consistent with the CARB Commercial Harbor Craft (CHC) regulation[4] (CARB 2022 CHC regulation amendment). Emissions from the following types of diesel-fueled harbor craft were quantified:

- Assist tugboats
- Articulated tug barge (ATB)
- Crew and supply boats
- Excursion vessels
- Ferry vessels
- Government vessels
- Harbor tugboats
- Ocean tugboats
- Work boats

Emissions Estimation Methodology

The methodology to estimate 2022 emissions from harbor craft is described in Section 3 of the San Pedro Bay Ports Emissions Inventory Methodology Report Version 4. The Port's harbor craft emission calculation methodology is consistent with CARB methodology[5].

Geographical Domain

Emissions are estimated for harbor craft operating within the South Coast Air Basin over-water boundary.

Data and Information Acquisition

Harbor craft owners and operators were contacted to obtain key physical and operational parameters, including:

- Type of harbor craft
- Engine count
- Engine horsepower (or kilowatts) for main and auxiliary engines
- Engine model year
- Operating hours in calendar year 2022

Operational Profiles

Table 3.2 lists the harbor craft engine count by USEPA marine engine emissions standards tier level and engine type in 2022.

Table 3.2: 2022 Harbor Craft Engine Tier Count

Engine Tier	Auxiliary Engine Count	Propulsion Engine Count	Total Engine Count
Unknown	18	0	18
Tier 0	22	12	34
Tier 1	5	11	16
Tier 2	24	92	116
Tier 3	123	51	174
Tier 4	0	24	24
Total	**192**	**190**	**382**

Table 3.3 summarizes the energy consumption (kWh) per engine tier for 2022 harbor craft that operated at the Port. The kWh for engines with unknown Tier were based on default engine kW and/or engine model year. Tier 2 to Tier 4 engines consumed 90% of the total harbor craft related energy for 2022.

Table 3.3: Harbor Craft Energy Consumption by Engine Tier, kWh and %

Engine Tier	2022 kWh	2022 % of Total
Tier 0	449,822	0.9%
Tier 1	4,226,339	8.6%
Tier 2	18,001,474	36.7%
Tier 3	18,352,782	37.4%
Tier 4	8,035,037	16.4%
Total	**49,065,454**	**100%**

Tables 3.4 and 3.5 summarize the characteristics of main and auxiliary engines, respectively, by vessel type operating at the Port in 2022. Averages of the model year, horsepower, or operating hours are used as default values when specific data is not available. Defaults were used for 1% of model year values (five engines), 7% of horsepower values (26 engines), and 1% of operating hours (five engines). Several companies operate harbor craft in the harbors of both the Ports of Long Beach and Los Angeles. For harbor vessels that share the work at both Ports in San Pedro Bay, the total hours are divided equally between the two ports.

Table 3.4: 2022 Propulsion Engine Characteristics by Harbor Craft Type

Propulsion Engines

SECTION 4 CARGO HANDLING EQUIPMENT

Source Description

Cargo handling equipment (CHE) typically operate at Port terminals or railyards to move cargo such as containers, general cargo, and bulk cargo to and from marine vessels, railcars, and on-road trucks. The majority of CHE are composed of off-road equipment not designed to operate on public roadways. This inventory includes CHE powered by engines fueled by diesel, gasoline, propane or electricity.

Emissions Estimation Methodology

The emissions calculation methodology used to estimate CHE emissions is consistent with CARB's latest methodology for estimating emissions from CHE.[6] Details of the methodology to estimate emissions from CHE is described in Section 4 of the San Pedro Bay Ports Emissions Inventory Methodology Report Version 4[7].

Geographical Domain

Emissions are estimated for CHE operating within Port terminals and facilities.

Data and Information Acquisition

The maintenance and/or CHE operating staff of each terminal were contacted to obtain equipment count and activity information on the CHE specific to their terminal or facility operations for the 2022 calendar year.

[6]CARB, 2017 Off-road Diesel Emission Factors and 2017 Off-road Diesel Emission Factors Documentation. *www.arb.ca.gov/our-work/programs/mobile-source-emissions-inventory/road-documentation/msei-documentation-*

Emission Estimates

A summary of CHE emissions by terminal type shows that 95% of the CHE emissions occur at the container terminals. The other terminal type is for the chassis yards that are within the Port and have cargo handling equipment.

Table 4.1: 2022 CHE Emissions by Terminal Type, tons and metric tons

Terminal Type	PM_{10} tons	$PM_{2.5}$ tons	DPM tons	NO_x tons	SO_x tons	CO tons	HC tons	CO_2e MT

Operational Profiles

Table 4.3 is a summary of all the CHE engines by fuel type, including electric equipment. In 2022, the electric equipment counts continued to increase (see Table 4.4). Of note, there are 9 electric RTG cranes at the Port. Zero emissions equipment demonstrated at terminals at any given time are not included in the inventory equipment counts.

Table 4.3: 2022 CHE Engines by Fuel Type

Equipment	Electric	Propane	Gasoline	Diesel	Total
Forklift	10	80	25	108	223
RTG crane	9	0	0	64	73

Total	**286**

Table 4.5 summarizes the characteristics of fossil fueled (i.e. diesel, gasoline, and propane) CHE data collected for the 2022 calendar year. The average values shown in the following tables are population-weighted and are used as default. For equipment without specific operational information available, default values associated with the specific equipment and engine type are used. For fossil fueled CHE, defaults were used for less than 1% model year values, 6% of horsepower values, and less than 1% of operating hour values.

Table 4.5: 2022 Engine Characteristics for Fossil Fueled CHE Operating at the Port

Table 4.6 is a summary of the emission reduction technologies[8] utilized in cargo handling equipment as retrofits to existing equipment, including diesel particulate filters (DPF) and BlueCAT retrofit for large-spark ignition (LSI) engines. Hybrid equipment, on-road engine, and renewable diesel counts have also been included in the table. In 2022, five container terminals had diesel equipment using renewable diesel which doubled the equipment count using it from 2021 when it was first introduced.

Table 4.6: 2022 CHE Emission Reduction Technologies by Equipment Type

Equipment	Hybrid Equipment	On-Road Engines	ULSD Fuel	Renewable Diesel	DPF Retrofit	BlueCAT Retrofit

Table 4.8 summarizes the energy consumption (kWh) for all of the equipment by engine tier. For diesel equipment, the equipment with higher tier levels (newer equipment) and those with on-road engines are generally used more than older equipment, which contributes to reduced emissions due to cleaner engine standards in newer equipment. In 2022, 84% of the energy consumed was by equipment with Tier 4i, Tier 4f, and on-road engines.

Table 4.8: Equipment Energy Consumption by Engine Type and Diesel Engine Standard, kWh and %

Engine Type	Engine Tier	kWh	% of Total

SECTION 5 RAILROAD LOCOMOTIVES

Source Description

Railroad locomotives are used to move trains transporting intermodal (containerized) freight and lesser amounts of dry bulk, liquid bulk, and carload (boxcar) freight to, from, and within the Port. Railroad locomotive activities at the Port consist of two different types of operations: the initiation or termination of long-distance cargo movements, known as line haul, and the short-distance movement of rail cars, such as the assembling and disassembling of trains in and around the Port, known as switching.

Rail operators Burlington Northern Santa Fe (BNSF) and Union Pacific (UP) provide line haul service to and from the Port and operate switching services at their off-port locations. Pacific Harbor Line (PHL) performs most of the switching operations within the Port.

Emissions Estimation Methodology

The methodology used to estimate 2022 emissions from rail locomotives follows the methodology as described in Section 5 of the San Pedro Bay Ports Emissions Inventory Methodology Report Version 4.

Geographical Domain

Emissions from railroad locomotives are estimated for movements of cargo by rail locomotives within Port boundaries, directly to or from port-owned properties such as terminals and on-port rail yards, or to and from the SoCAB boundary. The inventory does not include rail movements of cargo that occur solely outside the Port, such as off-port rail yard switching, and movements that neither begin nor end at a Port property, such as east-bound line hauls that initiate in central Los Angeles intermodal yards. Figure 1.1 in Section 1 of this report illustrates the geographical domain.

Data and Information Acquisition

Information from the following general sources was used to estimate emissions associated with Port-related activities of locomotives:

- Previous emissions studies
- Port cargo statistics
- Input from railroad operators
- Information published by EPA, the Surface Transportation Board, and other sources as cited in this report
- California Air Resources Board Memorandum of Understanding (CARB MOU)[9] line-haul fleet compliance data

The Port continues to use the most recent, locally specific data available, including MOU compliance data reflective of actual recent line haul fleet mix characteristics in the SoCAB. In addition, PHL has provided fuel consumption information for each locomotive in service in each calendar year, along with the engine tier levels of the locomotives. Table 5.1 lists the number of locomotives of each tier level that were operated in 2022, and the percentage of fuel used by locomotives in each tier. Discussion of the tiers and a list of tier-specific emission factors are included in Section 5 of the San Pedro Bay Ports Emissions Inventory Methodology Report Version 4.

Table 5.1: PHL Switching Fleet Mix

Locomotive Tier Level /Power Type	Count	% of Fuel Consumed
Genset	6	2%
Tier 3	0	0%
Tier 3+	17	96%
Tier 4	1	2%
Totals	**24**	**100%**

[9] *www.arb.ca.gov/resources/documents/rail-emission-reduction-agreements*
The 1998 Locomotive NO_x Fleet Average Emissions Agreement in the South Coast Air Basin, signed by CARB, Union Pacific Railroad (UP) and BNSF Railway (BNSF), accelerated the introduction of cleaner locomotives into the South Coast Air Basin. Under the Agreement, UP and BNSF agreed to operate locomotive fleets that "on average" meet a Tier 2 NO_x emission standard, or 5.5 g/bhp-hr by 2010 (and through 2030). The railroads submit detailed information on the locomotives operated in the SoCAB to demonstrate compliance with the agreement.

Emission Estimates

A summary of estimated emissions from locomotive operations related to the Port is presented in Table 5.2.

Table 5.2: 2022 Locomotive Emissions, tons and metric tons

Activity Component	PM_{10} tons	$PM_{2.5}$ tons	DPM tons	NO_x tons	SO_x tons	CO tons	HC tons	CO_2e MT
On-Port Emissions								
Switching	0.2	0.2	0.2	19.5	0.0	7.9	1.1	2,648
Line Haul	5.1	4.7	5.1	132.8	0.1	31.4	7.6	10,981
On-Port Subtotal	5.3	4.8	5.3	152.3	0.1	39.3	8.7	13,630
Off-Port (Regional) Emissions								
Switching	0.1	0.1	0.1	4.2	0.0	0.7	0.3	232
Line Haul	13.4	12.3	13.4	351.1	0.3	82.9	20.1	29,025
Off-Port Subtotal	13.5	12.4	13.5	355.3	0.3	83.6	20.3	29,257
Total	**18.8**	**17.2**	**18.8**	**507.6**	**0.5**	**122.9**	**29.1**	**42,886**

Operational Profiles

The goods movement rail system in terms of the activities that are carried out by locomotive operators is the same as described in detail in Section 5 of the San Pedro Bay Ports Emissions Inventory Methodology Report Version 4.

Table 5.3 presents the CARB MOU compliance information submitted annually by BNSF and UP on pre-Tier 0 through Tier 4 locomotive fleet composition, showing a weighted average NO_x emission factor of 5.56 g/bhp-hr.[10] The 2021 reports were used instead of 2022 because of the timing of the inventory data collection phase and of the posting of the compliance reports by CARB. The ultra-low emission locomotives (ULEL) are also included in the table but are not used in developing the line haul emission factors because the ULELs are believed to all be in switching service.

[10]Notes from railroads' MOU compliance submissions:
1. For more information on the U.S. EPA locomotive emission standards, *www.epa.gov/regulations-emissions-vehicles-and-engines/regulations-emissions-locomotives*
2. Number of locomotives is the sum of all individual locomotives that visited or operated within the SCAB at any time during 2021.

Table 5.3: CARB MOU Compliance Data, Megawatt-hours (MWh) and g NO_x/bhp-hr

Engine Tier	Number of Locomotives	Megawatt-hours (MWh)	% MWh by Tier Level	Wt'd Avg NO_x (g/bhp-hr)	Tier Contribution to Fleet Average (g/bhp-hr)

Emission factors for particulate matter (PM_{10}), HC, and CO were calculated using the tier-specific emission rates for those pollutants published by USEPA[11] to develop weighted average emission factors using the MWh figures provided in the railroads' submissions. These results are presented in Table 5.4.

Table 5.4: Fleet MWh and PM, HC, CO Emission Factors, g/hp-hr

Engine Tier	MWh	% of MWh	EPA Tier-specific			Fleet Composite		
			PM_{10}	HC	CO	PM_{10}	HC	CO
			g/bhp-hr			g/bhp-hr		
Pre-Tier 0	1,458	0%	0.32	0.48	1.28	0.001	0.00	0.01
Tier 0	22,466	6%	0.32	0.48	1.28	0.018	0.03	0.07
Tier 1	144,671	36%	0.32	0.47	1.28	0.116	0.17	0.46
Tier 2	122,771	31%	0.18	0.26	1.28	0.055	0.08	0.39
Tier 3	83,105	21%	0.08	0.13	1.28	0.017	0.03	0.27
Tier 4	26,291	7%	0.015	0.04	1.28	0.000	0.00	0.08
Totals	**400,762**	**100%**				**0.207**	**0.31**	**1.28**

Emission factors for $PM_{2.5}$ and DPM were calculated as fractions of PM_{10}, with $PM_{2.5}$ calculated as 94% of PM_{10} consistent with CARB methodology and DPM equal to PM_{10} because all PM emissions from diesel engines are defined as DPM. Rounding of emission factors before and after the conversion resulted in the emission factor values shown. Table 5.5 summarizes the emission factors for line haul locomotives, presented in units of g/bhp-hr.

Table 5.5: Emission Factors for Line Haul Locomotives, g/bhp-hr

	PM_{10}	$PM_{2.5}$	DPM	NO_x	SO_x	CO	HC	CO_2	N_2O	CH_4
EF, g/bhp-hr	0.207	0.190	0.207	5.42	0.005	1.28	0.31	489	0.013	0.040

[11]EPA Office of Transportation and Air Quality, "Emission Factors for Locomotives" EPA-420-F-09-025 April 2009.

On-Port Line Haul Activity

As described in the San Pedro Bay Ports Emissions Inventory Methodology Report, estimates of the number of trains per year, locomotives per train, and on-port hours per train are multiplied together to calculate total locomotive hours per year. This activity information for 2022 is summarized in Table 5.6.

Table 5.6: 2022 Estimated On-Port Line Haul Locomotive Activity

Activity Measure	Inbound	Outbound	Total
Trains per Year	2,180	1,775	3,955
Locomotives per Train	3	3	N/A
Hours on Port per Trip	1	2.5	N/A
Locomotive Hours per Year	6,540	13,313	19,853

Out-of-Port Line Haul Activity

Table 5.7 lists the estimated totals of travel distance, out-of-port trains per year, out-of-port million gross tons (MMGT), out-of-port MMGT-miles, gallons of fuel used, and horsepower-hours. Fuel consumption is calculated by multiplying gross ton-miles by the average fuel consumption factor of 0.963 gallons per thousand gross ton-miles.[12] Overall horsepower hours are calculated by multiplying the fuel used by the fuel consumption conversion factor of 20.8 hp-hr/gal.

Table 5.7: 2022 Gross Ton-Mile, Fuel Use, and Horsepower-hour Estimate

	Distance miles	Trains per year	MMGT per year	MMGT-miles per year
Alameda Corridor	21	3,770	28	588
Central LA to Air Basin Boundar	84	3,770	28	2,352
Million gross ton-miles				**2,940**
Estimated gallons of fuel (millions)				**2.83**
Estimated million horsepower-hours				**58.9**

SECTION 6 HEAVY-DUTY VEHICLES

Source Description

Heavy-duty vehicles (HDVs), or trucks, are used to move cargo, particularly containerized cargo, to and from the marine terminals. Trucks also transfer containers between terminals and off-port railcar loading facilities. The local activity is often referred to as drayage. During their daily operations, trucks are driven onto and through the terminals, where they deliver and/or pick up cargo. They are also driven on the public roads within the Port boundaries and on the public roads outside the Port.

The majority of trucks that service the Port's terminals are diesel-fueled vehicles. Alternatively fueled trucks, primarily those fueled by liquefied natural gas (LNG) also service the SPBP. The emission estimates prepared using this methodology reflect the use of both types of fuel. In addition, approximately 0.25% of the trucks were zero emissions trucks in 2022 and included battery electric and hydrogen fuel cell trucks.

Emissions Estimation Methodology

The methodology used to estimate 2022 emissions from HDVs is described in Section 6 of the San Pedro Bay Ports Emissions Inventory Methodology Report Version 4. HDV emission estimates are based on estimates of vehicle miles traveled (VMT), average speeds, CARB's on-road vehicle Emission Factors model (EMFAC) and HDV model year information specific to the San Pedro Bay ports. The most recent version of the model, EMFAC2021, reflects CARB's current understanding of motor vehicle travel activities and their associated emission levels. A new feature of this version of the model is the ability to produce emission factors for natural gas fueled trucks in addition to the more common diesel fueled trucks.

Geographical Domain

Two major geographical components of truck activities were evaluated for this inventory:

- **On-terminal operations**, which include waiting for terminal entry, transiting the terminal to drop off and/or pick up cargo, and departing the terminals.

- **On-road operations**, consisting of travel on public roads within the SoCAB. This also includes travel on public roads within the Port boundaries and those of the adjacent Port of Los Angeles (POLA). The activity of on-road trucks included within the geographical domain is from the Port to the cargo's first point of rest within SoCAB or up to the basin boundary, whichever comes first.

Data and Information Acquisition

Information regarding the activity of trucks while they are on terminal, such as average times and distances traveled through the terminal, is collected during in-person and/or telephone interviews with terminal personnel. For on-road operations, the volumes (number of trucks), distances, and average speeds on roadway segments between defined intersections are estimated using trip generation and travel demand models that have been developed for these purposes. The trip generation model is used to develop truck trip numbers for container terminals, while the terminal interviews are used to obtain trip counts associated with non-container terminals.

The model year distribution of HDVs operating at the Port is developed using radio frequency identification (RFID) call information gathered at the San Pedro Bay Ports' container terminals and truck/engine model year data from the Port Drayage Truck Registry (PTDR). The RFID call information is only collected at container terminals, so it is assumed for the inventory that trucks calling at other Port terminals have the same general distribution of model years.

Emission Estimates

Tables 6.1 through 6.3 summarize the vehicle miles traveled and emissions associated with overall HDV activity, emissions associated with container terminal activity, and emissions associated with other Port terminals, respectively.

Table 6.1: 2022 HDV Emissions, tons and metric tons

Activity Location	Vehicle Miles Traveled	PM_{10} tons	$PM_{2.5}$ tons	DPM tons	NO_x tons	SO_x tons	CO tons	HC tons	CO_2e MT

On-Terminal	127,998	0.004	0.004	0.003	6	0.014	6.9	0.8	1,582
On-Road	29,158,385	0.6	0.6	0.6	70	0.4	15.7	2.1	46,428
Total	**29,286,383**	**0.6**	**0.6**	**0.6**	**76**	**0.5**	**22.6**	**2.9**	**48,010**

Operational Profiles

To estimate the 2022 emissions from HDVs, operational profiles were developed for on-terminal truck activity using data and information collected from terminal operators. The on-road truck activity profiles were developed using trip generation and travel demand models to estimate the number of on-road VMT.

The model year distribution of HDVs was determined using RFID information collected at Port terminals to track the number of truck calls, and truck model year information from the PDTR. The distribution of the model years of the trucks that called at the SPBP terminals during 2022 is presented in Figure 6.1. The call weighted average age of the trucks in 2022 was approximately 7 years.

Figure 6.1: 2022 Model Year Distribution of HDV Fleet

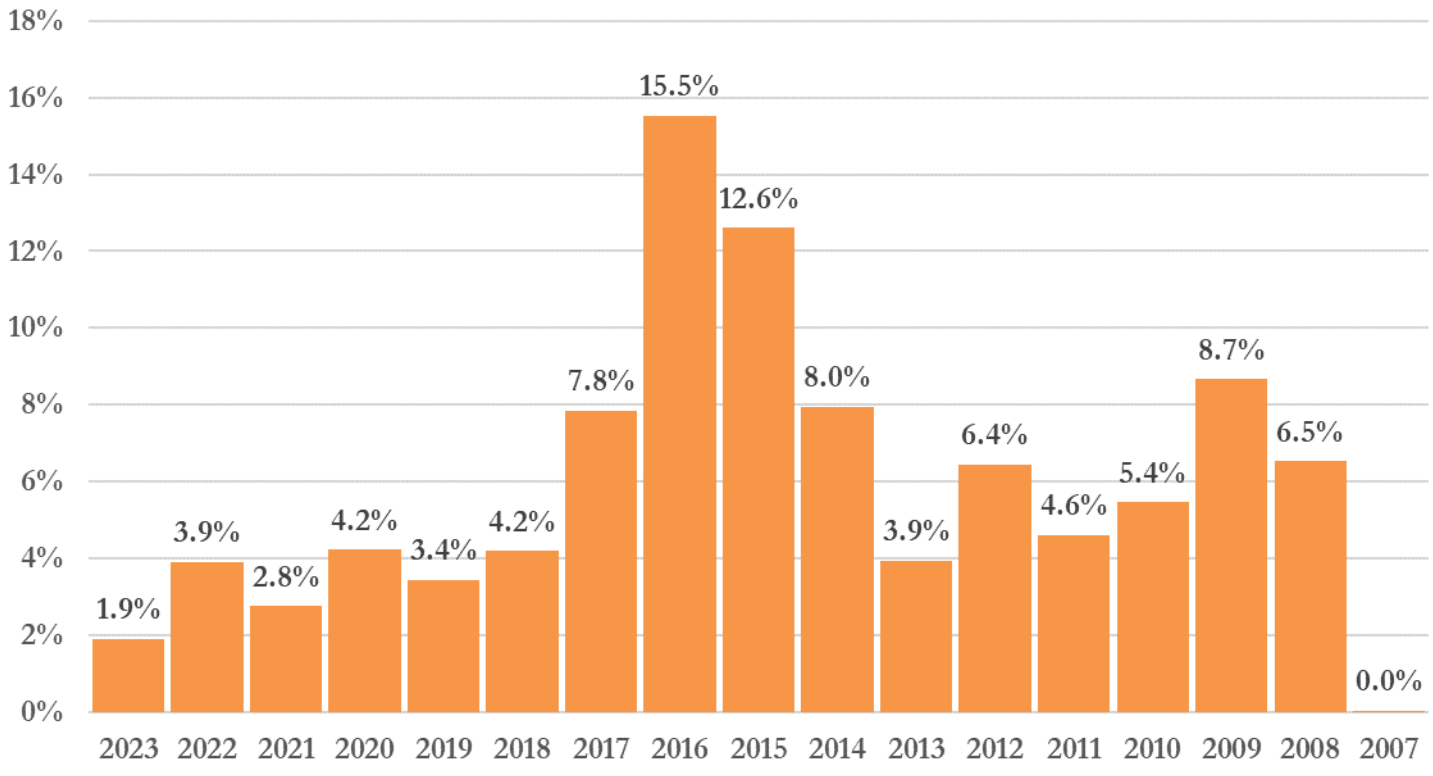

Table 6.4 shows the range and average of reported operating characteristics of on-terminal truck activities at Port container terminals, including speed, distance driven, and total time on terminal including terminal entry queuing. Table 6.5 shows the same summary data for non-container terminals and facilities. Trucks may have wait times when coming into the terminal (gate in) and also on their way out (gate out). Once inside the terminal, there is also time involved loading and/or unloading cargo.

Table 6.4: 2022 Summary of Reported Container Terminal Operating Characteristics

	Speed (mph)	Distance (miles)	Time on Terminal (hours)
Maximum	15	3.5	1.70
Minimum	7	0.5	0.61
Average	10	1.4	1.17

Table 6.5: 2022 Summary of Reported Non-Container Facility Operating Characteristics

	Speed (mph)	Distance (miles)	Time on Terminal (hours)
Maximum	10	0.5	0.55
Minimum	5	0.0	0.00
Average	7	0.2	0.13

In 2022, a total 3,984,102 truck calls were associated with container terminals and 559,365 truck calls were associated with non-container facilities. The total number of truck calls associated with container terminals is estimated by the trip generation model on which truck travel VMT estimates are based, while non-container terminal truck calls were obtained from the terminal operators. The non-container terminal number includes activity at the Port's overflow container and chassis support facilities that operated in 2022, totaling approximately 351,000 calls. The chassis yards are used for pickup, delivery and maintenance of chassis while the short term overflow container facilities help streamline movement of cargo during peak season.

Table 6.6 provides the on-terminal operating parameters, listing total estimated VMT and hours of idling on-terminal and waiting at entry gates. The idling times are likely to be over-estimated because the idling estimates are based on the entire time that trucks are on terminal (except for driving time), which does not account for times that trucks are turned off while on terminal. To date, no other data sources have been identified to provide a reliable estimate of the average percentage of time the trucks' engines are turned off while on terminal.

Table 6.6: 2022 Estimated On-Terminal VMT and Idling Hours by Terminal

Terminal Type	Total Miles Traveled	Total Hours Idling (all trips)
Container	2,077,023	753,662

Total	**5,213,355**	**4,977,545**

Table 6.7 summarizes the speed bin composite emission factors developed from the EMFAC2021 model and the port-specific model year distribution. These composite emission factors are developed using model year specific emission factors for the T7 POLA vehicle category of EMFAC2021 which also applies to drayage trucks calling at POLB terminals. They reflect the use of diesel and natural gas fuel, based on evaluation of the Port's Clean Truck Program (CTP) activity records and the Port Drayage Truck Registry (PDTR).

SECTION 7 SUMMARY OF 2022 EMISSION RESULTS

The Port of Long Beach 2022 Air Emissions Inventory results are presented in this section. Table 7.1 summarizes the 2022 air emissions associated with the goods movement-related sources at the Port, by category.

Table 7.1: 2022 Emissions by Source Category, tons and metric tons

Category	PM_{10} tons	$PM_{2.5}$ tons	DPM tons	NO_x tons	SO_x tons	CO tons	HC tons	CO_2e MT
Ocean going vessels	85	78	45	3,738	185	345	146	349,871
Harbor craft	7	6	7	317	0	61	13	34,671
Cargo handling equipment	10	9	8	248	2	1,151	40	133,039
Locomotives	19	17	19	508	0	123	29	42,886
Heavy-duty vehicles	5	5	5	725	4	323	40	406,301
Total	**125**	**115**	**84**	**5,535**	**192**	**2,002**	**268**	**966,768**

Table 7.2 shows the emissions percent contribution by source category. Of the total port wide emission sources, ocean-going vessels are the largest source of DPM, NO_x and SO_x emissions. Rail locomotives are the second highest source of DPM emissions. HDV are the highest source of CO_2e emissions and second highest source of NO_x emissions.

Table 7.2: 2022 Emissions Percent Contributions by Source Category

Source Category	DPM		NO_x		SO_x		CO_2e	
	tons	%	tons	%	tons	%	MT	%
Ocean going vessels	45	54%	3,738	68%	185	96.7%	349,871	36%
Harbor craft	7	8%	317	6%	0	0.2%	34,671	4%
Cargo handling equipment	8	10%	248	4%	2	0.8%	133,039	14%
Rail locomotives	19	22%	508	9%	0	0.2%	42,886	4%
Heavy-duty vehicles	5	6%	725	13%	4	2.0%	406,301	42%
Total	**84**	**100%**	**5,535**	**100%**	**192**	**100.0%**	**966,768**	**100%**

To place the maritime industry-related emissions into context, the following figures compare the Port's contributions to the total emissions in the South Coast Air Basin by emission source category.

Figure 7.1: 2022 PM_{10} Emissions in the South Coast Air Basin, %

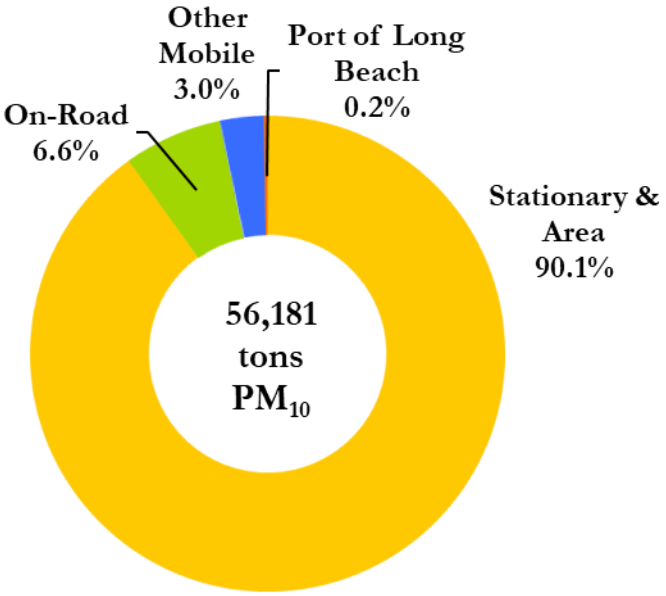

Figure 7.2: 2022 $PM_{2.5}$ Emissions in the South Coast Air Basin, %

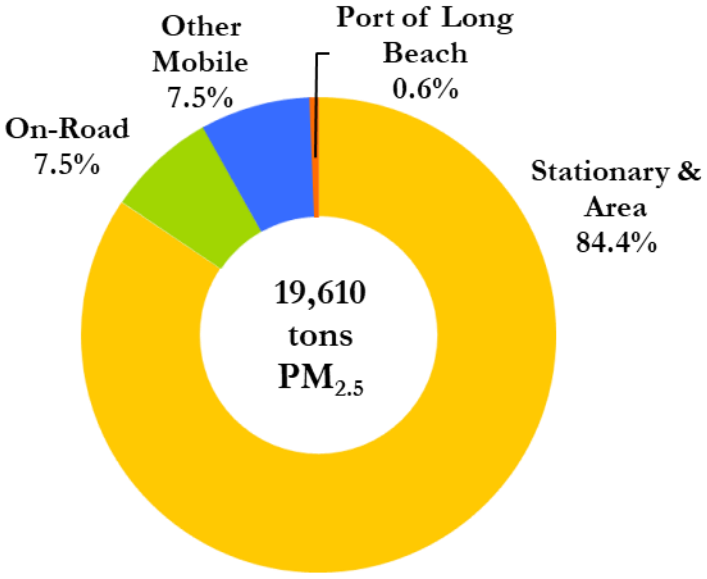

Figure 7.3: 2022 DPM Emissions in the South Coast Air Basin, %

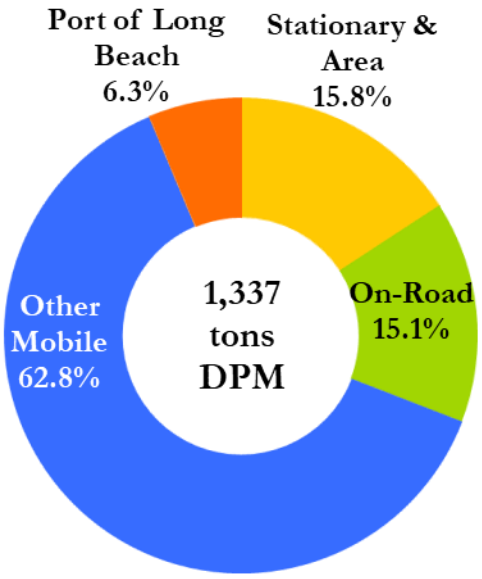

Figure 7.4: 2022 NO_x Emissions in the South Coast Air Basin, %

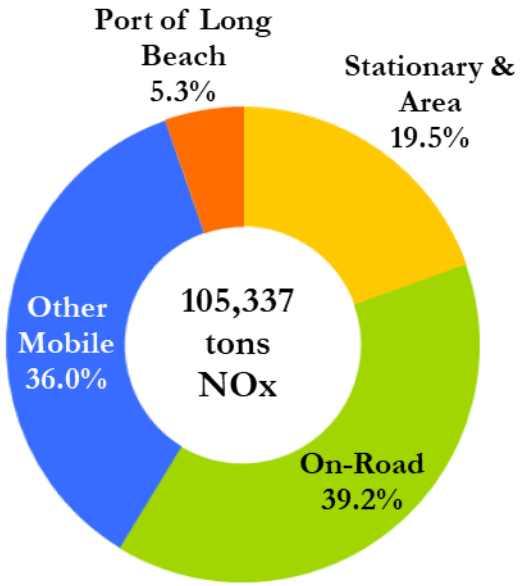

Figure 7.5: 2022 SO_x Emissions in the South Coast Air Basin, %

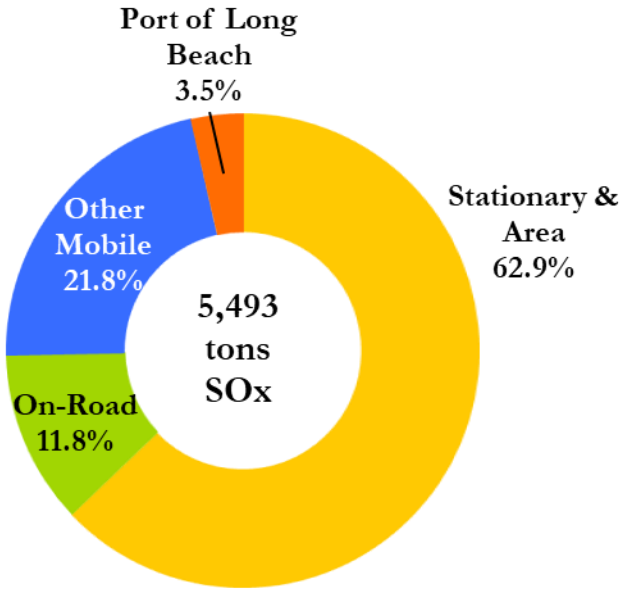

Tables 7.3 through 7.8 list the percent emissions contribution. The 2022 SoCAB emissions are based on the 2022 AQMP Appendix III[13], except for the SoCAB on-road emission estimates which were updated to take into consideration EMFAC2021[14]. Thus, the SoCAB total emissions shown on the bottom row of the tables do not exactly match 2022 AQMP Appendix III values. It should be noted that SoCAB on-road heavy-duty diesel PM_{10} and $PM_{2.5}$ emissions do not include brake and tire wear emissions consistent with the Port's HDV emissions.

[13]SCAQMD, *2022 AQMP Appendix III, Base & Future Year Emission Inventory*, adopted December 2022. Except on-road emissions based on EMFAC2014 are replaced with EMFAC2021 estimates. *www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan.*

SECTION 8 COMPARISON OF 2022 AND 2005 FINDINGS AND EMISSION ESTIMATES

This section provides a comparison of the emission estimates for 2022 and 2005 by source category. The baseline year used to compare every annual inventory is 2005. The cargo handling emissions were updated to be consistent with CARB latest methodology.

Table 8.1: 2005-2022 Port Emissions Comparison by Source Category, tons, metric tons and %

Table 8.2 provides a comparison of the number of vessel calls and container cargo throughput as well as the average TEUs per containership call between 2005 and 2022. Compared to 2005, container throughput is up 36%, while overall containership arrivals to POLB are down 32%. The average number of containers per containership is 10,137 TEU per containership call in 2022, indicative of larger containerships calling at POLB.

Table 8.2: Container Throughput and Vessel Call Comparison

Year	Container Throughput (TEU)	All Arrivals	Containership Arrivals	Average TEU per Call
2005	6,709,818	2,617	1,332	5,037
2021	9,384,368	1,905	912	10,290
2022	9,133,657	2,068	901	10,137
CAAP Progress	**36%**	**-21%**	**-32%**	**101%**
Previous Year	**-3%**	**9%**	**-1%**	**-1%**

Table 8.3 presents the total net change in emissions for all pollutants. Emissions are lower for all pollutants compared to baseline 2005 and previous year 2021.

Table 8.3: Emissions Comparison, tons, metric tons and %

Year	PM_{10}	$PM_{2.5}$	DPM	NO_x	SO_x	CO	HC	CO_2e
2005	1,183	994	912	15,064	6,975	2,820	748	977,845
2021	170	157	116	7,686	252	2,154	355	1,148,248
2022	125	115	84	5,535	192	2,002	268	966,768
CAAP Progress	**-89%**	**-88%**	**-91%**	**-63%**	**-97%**	**-29%**	**-64%**	**-1%**
Previous Year	**-27%**	**-27%**	**-28%**	**-28%**	**-24%**	**-7%**	**-25%**	**-16%**

The following paragraphs summarize the overall reasons for the differences in 2005 and 2022 emissions by source category.

Ocean-Going Vessels

Emissions from OGVs were lower in 2022 compared to 2005 levels as a result of significantly increased participation in the Port's Green Flag incentive and Green Ship Incentive programs, CARB's low sulfur marine fuel regulation requiring distillate fuels used by ocean going vessels with a maximum sulfur content of 0.1%, North American Emission Control Area (ECA), and implementation of the CARB's control measure for OGV at-berth regulation. Emission reductions have also occurred due to increased vessel efficiency and utilization due to the deployment of larger container vessels that has resulted in fewer vessel calls.

Harbor Craft

Harbor craft emissions decreased for all pollutants. The decrease is due to the turnover to newer engines which have lower emission standards and the use of lower sulfur content fuel. Between 2005 and 2022, fleet turnover was accelerated as a result of CARB's in-use harbor craft regulations and grant funding made available, such as Carl Moyer and EPA grants, for the replacement of older engines with newer and cleaner engines. CO_2e emissions are not influenced from the introduction of cleaner engines for NO_x and PM because the engines do not have lower standards for CO_2.

Cargo Handling Equipment

Cargo handling equipment emissions decreased for all pollutants, except for CO and CO_2e. The decrease is due to fleet turnover to newer CHE which have lower emission standards and use of lower sulfur content fuel. Since 2005, fleet turnover accelerated as a result of the continued replacement and retrofit of existing equipment with cleaner engines and implementation of CAAP Tier 4 measures, green leases, grant funding, and the CARB in-use CHE regulation. The increase in CO emissions from cargo handling equipment is attributed to the increased activity of gasoline fueled equipment with higher CO emission rates compared to diesel equipment. The increase in CO_2e is mainly due to the increase in energy consumption in 2022 as compared to 2005 and lack of any CO_2e emission standards. In 2022, several container terminals used renewable diesel, which lowered CO_2e tailpipe emissions.

Locomotives

Emissions from rail locomotives were lower in 2022 compared to 2005 due in part to the turnover of locomotives to cleaner ultra-low emissions switching locomotives in the PHL and UP fleets. In addition, use of cleaner fuels and cleaner line haul locomotives by both UP and BNSF contributed to the reduced emissions.

Heavy-Duty Vehicles

Truck emissions were significantly lower in 2022 compared to 2005 due to the implementation of the Port's Clean Trucks Program that progressively banned older, higher-emitting trucks from Port terminals. The most recent stage requires that newly registered trucks must be model year 2014 or newer. In 2022, the share of mileage driven by 2014 and newer model year trucks increased to 64% which shows the impact of the Port Tariff on the drayage trucks working at the Port and lowers NO_x and PM emissions. The CTP and engine emission standards are responsible for most reductions, including the particulate and NO_x decreases, while fuel sulfur standards, specifically the introduction of ultra-low sulfur diesel fuel (ULSD), are responsible for the SO_x reduction. Other factors include normal fleet turnover and decreased total vehicle miles travelled due to the increase in utilization of on-dock rail and changes in regional travel patterns since 2005. CO_2e emissions are not influenced from the introduction of cleaner engines for NO_x and PM because the engines do not have lower standards for CO_2.

Emissions Comparison to Previous Year

Between 2021 and 2022, OGV emissions decreased significantly as the goods movement system recovered from the COVID-19 impacts and the Port returned to normal operations. The decrease is due to fewer vessels at anchorage, as well as vessels spending less time at berth and at anchorage. Table 8.4 compares the 2022 emissions to the previous year which shows the emission are lower in 2022 for all source categories. 2021 emissions for OGV are updated with revised auxiliary load for vessels at anchorage due to drifting that occurred in 2021.

Table 8.4: 2021-2022 Air Emissions Comparison by Source Category

	PM_{10} tons	$PM_{2.5}$ tons	DPM tons	NO_x tons	SO_x tons	CO tons	HC tons	CO_2e MT

In 2022, there were 9% more vessel calls than in 2021, but the shifts mainly from anchorage, were 29% lower and anchorage calls 24% lower in 2022.

Table 8.5: 2021-2022 Shift Calls Comparison

Vessel Type	2021 Shift	2022 Shift	2021-2022 Change
Containership	1,133	300	-74%
Tanker	810	953	18%
Cruise	14	1	-93%

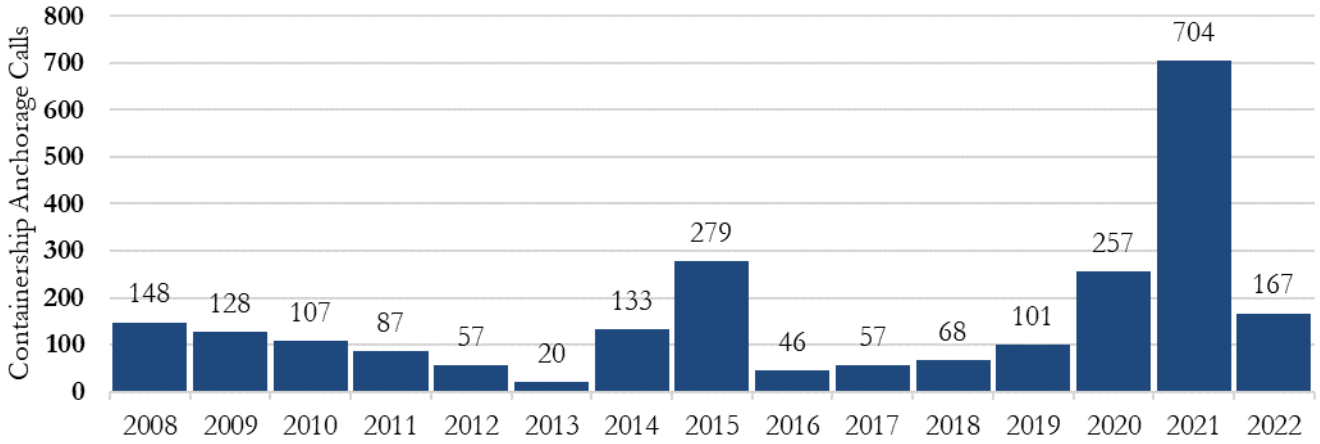
Total	**1,501**	**1,138**	**-24%**

Figure 8.1 shows anchorage calls trend for containerships and illustrates the significant decrease in containerships at anchorage in 2022. The lower shift and anchorage calls in 2022 attributed to the lower emissions for ocean going vessels.

Figure 8.1: Containership Anchorage Calls Trend



Calendar year 2022 saw a return to near normal port operations after two challenging years since the COVID-19 pandemic. Below are source category specific explanations for the emission changes when comparing 2022 to 2021:

- For OGVs, the total calls were higher by 9% in 2022, but there were significantly fewer vessels waiting for a berth assignment which resulted in lower shifts and anchorage calls. Vessel calls with propulsion engines that meet the Tier III NO_x emission standard continued to increase. Tier 3 engines are 75% cleaner than the Tier II engine standard. In 2022, several vessels called the Port using LNG as a primary fuel.

- For harbor craft, the vessel count and total energy consumed (kWh) were lower in 2022 compared to 2021.

- For CHE, the 2022 emissions are slightly lower than 2021 due to lower equipment activity which is in line with the TEU cargo decrease. In 2022, terminal operators continued to switch to renewable diesel which lowers the CO_2e tailpipe emissions.

- For locomotives, the slight decrease in emissions is due to reductions in the line haul fleet composite emission factors resulting from line haul fleet mix improvement.

- For heavy-duty vehicles, the PM and NO_x emissions decreased due to continued fleet turnover to newer trucks in 2022. The share of mileage driven by 2014 and newer model year trucks increased from 48% in 2021 to 64% in 2022, which is a significant milestone.

Ocean-Going Vessels

Overall energy consumption (in terms of kWh) by OGV emission sources in 2005, 2020, and 2021 are shown in Table 8.7. The kWh associated with the CAECS generators are included with the auxiliary engine kWh shown in the table. The main engine activity has decreased since 2005 mainly due to the Vessel Speed Reduction (VSR) program and fewer vessel calls. The auxiliary boiler activity increased compared to 2005 as there currently is no program or regulation to decrease the boiler activity or emissions. In 2022, there were only seven calls that used a CAECS as there are no additional barges with alternative capture and control systems available.

Table 8.7: OGV Energy Consumption Comparison by Emission Source, kWh

Year	All Emission Sources	Main Eng	Aux Eng	Boiler
2005	506,332,609	148,941,469	228,719,799	128,671,341
2021	619,547,417	70,783,418	303,111,349	245,652,650
2022	425,044,190	72,788,600	171,560,833	180,694,757
CAAP Progress	**-16%**	**-51%**	**-25%**	**40%**
Previous Year	**-31%**	**3%**	**-43%**	**-26%**

Table 8.8 summarizes the distribution of main engine IMO NO_x standards tier calls (Tier). NO_x emissions for Tier III vessels are 75% cleaner than Tier II vessels when operating at or above 25% main engine load. The increase in Tier III vessels continued in 2022.

Table 8.8: OGV Main Engine Calls by IMO NO_x Tiers

Year	IMO Tier 0	IMO Tier I	IMO Tier II	IMO Tier III	No Tier
2005	54%	42%	0%	0%	4%
2021	5%	49%	38%	4%	4%
2022	8%	45%	38%	5%	3%

The No Tier column represents vessels that do not have diesel engines, such as steamships or vessels with gas turbines. Tier I refers to calls by vessels meeting or exceeding Tier I standards (vessels constructed from 2000-2010), Tier II refers to calls by vessels meeting or exceeding Tier II standards (vessels constructed from 2011-2015), and Tier III refers to calls by vessels meeting or exceeding the Tier III standards, which are in effect in the North American ECA for vessels constructed on or after January 1, 2016.

The various emission reduction strategies for ocean-going vessels that were in effect in 2022 are listed in Table 8.9. The number of vessels utilizing shore power is slightly lower in 2022 than the previous year.

Table 8.9: OGV Emission Reduction Strategies

Year	Shore Power	VSR 20 nm	VSR 40 nm	ESI	EIAPP Main Eng	EIAPP Aux Eng
2005	0%	68%	0%	0%	0%	0%
2021	36%	94%	88%	47%	59%	58%
2022	35%	93%	88%	43%	58%	57%

The following OGV emission reductions strategies are listed:

- Shore Power refers to vessel calls using shore power at berth, instead of running their diesel-powered auxiliary engines.
- VSR refers to the vessels reducing their transit speed to 12 knots or lower within 20 and 40 nm of Point Fermin as part of the Port's Green Flag Program.
- ESI refers to the number of vessel calls that participated in the ESI program which evaluates the environmental performance of a vessel. ESI is a component of the Green Ship incentive program which encourages cleaner vessels to come to the Port.
- Engine International Air Pollution Prevention (EIAPP) certificates refer to the number of vessel calls using ship-specific NO_x emission factors for main and auxiliary engines, where vessel specific EIAPP certificates with actual NO_x rating were available through the ESI program or the VBP.

Harbor Craft

As shown in Table 8.10, compared to 2005, the harbor craft vessel count (including ATBs) operating at the Port in 2022 remained the same, and total engine count increased by 27%. There was an 1% increase in the overall energy consumption (kWh) from 2005 to 2022. Compared to previous year, the energy consumption in 2022 is 7% lower and the number of vessels decreased by 4%.

Table 8.10: Harbor Craft Count and Energy Consumption Comparison

Year	Vessel Count	Engine Count	Total kWh
2005	92	301	48,556,571
2021	96	406	52,760,806
2022	92	382	49,065,454
CAAP Progress	**0%**	**27%**	**1%**
Previous Year	**-4%**	**-6%**	**-7%**

Table 8.11 summarizes the distribution of engines based on EPA's engine standards. Since 2005, the percentage of Tier 2, Tier 3, and Tier 4 engines increased significantly due to the introduction of newer vessels with newer engines into the fleet and replacements of existing higher-emitting engines with cleaner engines. Over the years, with better data collection techniques and better record keeping required with grant funded repowers, the number of engines of unknown tier level has decreased significantly.

Table 8.11: Harbor Craft Engine Tier Change, %

	2005 Engine Count	2021 Engine Count	2022 Engine Count	2005-2022 % Change	2021-2022 % Change
Unknown	102	24	18	-82%	-25%
Tier 0	86	34	34	-60%	0%
Tier 1	102	19	16	-84%	-16%
Tier 2	11	148	116	955%	-22%
Tier 3	0	171	172	100%	1%
Tier 4	0	10	26	100%	160%
Total	**301**	**406**	**382**	**27%**	**-6%**

Table 8.12 compares the harbor craft energy consumption (kWh) by engine tier. In 2022, 90% of energy consumed by harbor craft is from Tier 2 to Tier 4 engines.

Table 8.12: Engine Energy and Activity Change, kWh and %

Engine Tier	2005 kWh	2005 % of Total	2021 kWh	2021 % of Total	2022 kWh	2022 % of Total
Tier 0	31,357,757	64.6%	3,113,001	5.9%	449,822	0.9%
Tier 1	16,937,667	34.9%	4,443,548	8.4%	4,226,339	8.6%
Tier 2	261,146	0.5%	23,450,610	44.4%	18,001,474	36.7%
Tier 3	0	0.0%	16,963,046	32.2%	18,352,782	37.4%
Tier 4	0	0.0%	4,790,600	9.1%	8,035,037	16.4%
Total	**48,556,571**	**100%**	**52,760,806**	**100%**	**49,065,454**	**100%**

Cargo Handling Equipment

In 2022, there is 20% more equipment and 35% more energy consumption for fossil-fueled equipment than in 2005. These increases are needed to accommodate the 36% increase in TEU throughput and operational changes at the Port over the years. The largest increase in equipment count is for electric equipment. In 2022, there are 286 pieces of electric equipment operating at the Port or 19% of the total CHE.

Table 8.13 shows the energy consumption (in kWh) from fossil-fueled equipment, but the equipment count includes electric equipment. Compared to the previous year, there was a 6% decrease in energy consumption. The overall equipment counts increased 3% due mainly to new electric equipment. As an example, 37 added electric equipment to the 2022 inventory is a 13% increase to the electric equipment count from the previous year.

Table 8.13: CHE Count and Energy Consumption Comparison

Year	Equipment Count	Activity (kWh)
2005	1,259	134,618,521
2021	1,462	181,323,340
2022	1,507	170,906,171
CAAP Progress	**20%**	**27%**
Previous Year	**3%**	**-6%**

Table 8.14 shows the equipment energy consumption (kWh) comparison for diesel fueled equipment by diesel engine tier and by non-diesel fueled equipment for calendar years 2022, 2021 and 2005. Among diesel equipment, 84% of the energy consumed in 2022, is from equipment with on-road engines and Tier 4 engines.

Table 8.14: CHE Energy Consumption Comparison by Engine Tier, kWh

Engine Type	Engine Tier	2005 kWh	2005 % of Total	2021 kWh	2021 % of Total	2022 kWh	2022 % of Total
Diesel	Tier 0	12,023,155	9%	34,294	0.02%	31,624	0.02%
Diesel	Tier 1	65,059,472	48%	7,955,909	4%	3,233,485	2%
Diesel	Tier 2	49,337,838	37%	5,366,862	3%	4,164,583	2%
Diesel	Tier 3	41,636	0.03%	2,588,189	1%	2,166,705	1%
Diesel	Tier 4i	0	0%	29,431,289	16%	25,378,687	15%
Diesel	Tier 4f	0	0%	76,189,083	42%	80,578,225	47%
Diesel	Onroad	6,610,773	5%	40,114,171	22%	37,899,056	22%
Gasoline		3,866	0.003%	19,147,622	11%	16,982,124	10%
Propane		1,541,782	1%	495,920	0%	479,256	0.3%
Total		**134,618,521**	**100%**	**181,323,340**	**100%**	**170,913,744**	**100%**

Tables 8.15 and 8.16 compare the CHE emission reduction technologies and fuels used in 2022 with those used in 2005. Compared to 2005, there is a significant increase in the number of CHE equipped with cleaner on-road engines in 2022. All of the DPF retrofits installed are on equipment at Tier 3 or lower level, thus the count is lower for 2022. The hybrid RTG cranes counts increased in 2022.

For Table 8.16, the reason for the lower percent of diesel equipment using ULSD is that roughly half of the diesel-powered equipment are using renewable diesel in 2022. The electric equipment count increase is due to the newly converted RTG cranes and new electric equipment purchases, such as automated guided vehicles (AGVs) at one terminal.

Table 8.15: CHE Diesel Powered Equipment Emissions Control Matrix

Other	3	11	1	111	126
Total	**5**	**133**	**2**	**1,119**	**1,259**
	0.4%	**11%**	**0.2%**	**89%**	

Table 8.17 shows a comparison of CHE counts by equipment type. In total, there is a 20% increase in equipment count from 2005 to 2022, with the largest increase for electric equipment, followed by top handlers. There is a significant decrease for side handlers as top handler counts increase. Electric equipment accounts for 19% of the total equipment at the Port in 2022. Compared to the previous year, the total equipment counts increased by 3% mainly due to more electric equipment.

Table 8.17: CHE Equipment Count

Equipment	2005	2021	2022
Forklift	295	220	213
RTG crane	85	65	64
Side handler	43	3	5
Top handler	113	195	201
Yard tractor	641	639	646
Sweeper	15	21	20
Electric	na	249	286
Other	67	70	72
Total	**1,259**	**1,462**	**1,507**

Table 8.18 shows the electric equipment count for 2022, previous year and 2005. In 2005, the count of electric ship to shore cranes was not included in the 2005 EI.

Table 8.18: CHE Count of Electric Equipment

Equipment	2005 Electric	2021 Electric	2022 Electric
AGV	0	72	102
ASC	0	69	69
Cone vehicle	0	3	3
Crane	0	7	7
Electric pallet jack	2	2	0

Total	**5**	**249**	**286**

Locomotives

Table 8.19 shows the various throughput comparisons for rail transportation in 2005 and 2022. The total port throughput between calendar years 2005 and 2022 was higher by 36% in 2022. The on-dock rail throughput was higher in 2022 than in 2005. The on-dock rail percent of total throughput increased from 16% to 18% between 2005 and 2022.

Table 8.19: Container Throughput Comparison, TEU and %

	2005	2021	2022	2005-2022 Change	2021-2022 Change
Total Port Throughput	6,709,818	9,384,368	9,133,657	36%	-3%
Total On-Dock Rail*	1,094,765	1,835,438	1,632,803	49%	-11%
% On-Dock	16%	20%	18%		

*Based on average of 1.8 TEUs per container

Heavy-Duty Vehicles

Emissions from the HDV source category continue to be far lower than in 2005 due largely to the following factors affecting the overall age of the truck fleet.

- Newer fleet of trucks due to the Port's Clean Trucks Program (CTP). As of 2018, newly registered trucks must be model year 2014 or newer. As of 2022, 64% of calls were made by trucks of model year 2014 and newer.
- The terminals optimized their gate systems and they use radio frequency identification (RFID) readers to identify trucks complying with the CTP provisions, which helped reduce idling time.
- Terminal automation reduces wait times and limits turn times compared with traditional terminal operations.

The CTP and engine emission standards are responsible for most of the reductions, including the particulate and NO_x decreases, while sulfur fuel standards, specifically the introduction of ultra-low sulfur diesel fuel (ULSD), are responsible for the SO_x reduction.

Table 8.20 shows total port-wide estimated on-terminal idling times reported in 2005, 2021 and 2022. The 2022 port-wide idling time is based on an improved source of data regarding the time spent by trucks while on terminal (turn time) which, relates to time that may not solely be time spent idling. Total idling increased 5% as compared to the previous year and 29% since 2005. The increase in idling since 2005 may be due in part to the increase in TEU throughput, which resulted in more truck trips. Both the increase since 2005 and the recent increase since 2021 are partly due to improved and more accurate data sources. Continued improvement in data sources may provide more information regarding actual on-terminal idling times (as opposed to turn times).

Table 8.20: HDV Total Idling Time Comparison, hours and %

EI Year	Total Idling Time (hours)
2005	3,854,273
2021	4,744,801
2022	4,977,545
CAAP Progress	**29%**
Previous Year	**5%**

Table 8.21 compares the vehicle miles traveled by heavy-duty trucks in 2005, 2021 and 2022. Reported on-terminal VMT in 2022 was higher than in 2005 because of increased throughput and because several terminals re-evaluated their operations and provided higher estimates of average on-terminal driving distances.

Table 8.21: HDV Vehicle Miles Traveled Comparison, miles and %

Activity Location	2005 VMT	2021 VMT	2022 VMT	2005-2022 Change	2021-2022 Change
On-Terminal	2,866,476	5,326,745	5,213,355	82%	-2%
On-Road	213,716,895	223,724,822	223,425,938	5%	0%
	216,583,371	**229,051,567**	**228,639,293**	**6%**	**0%**

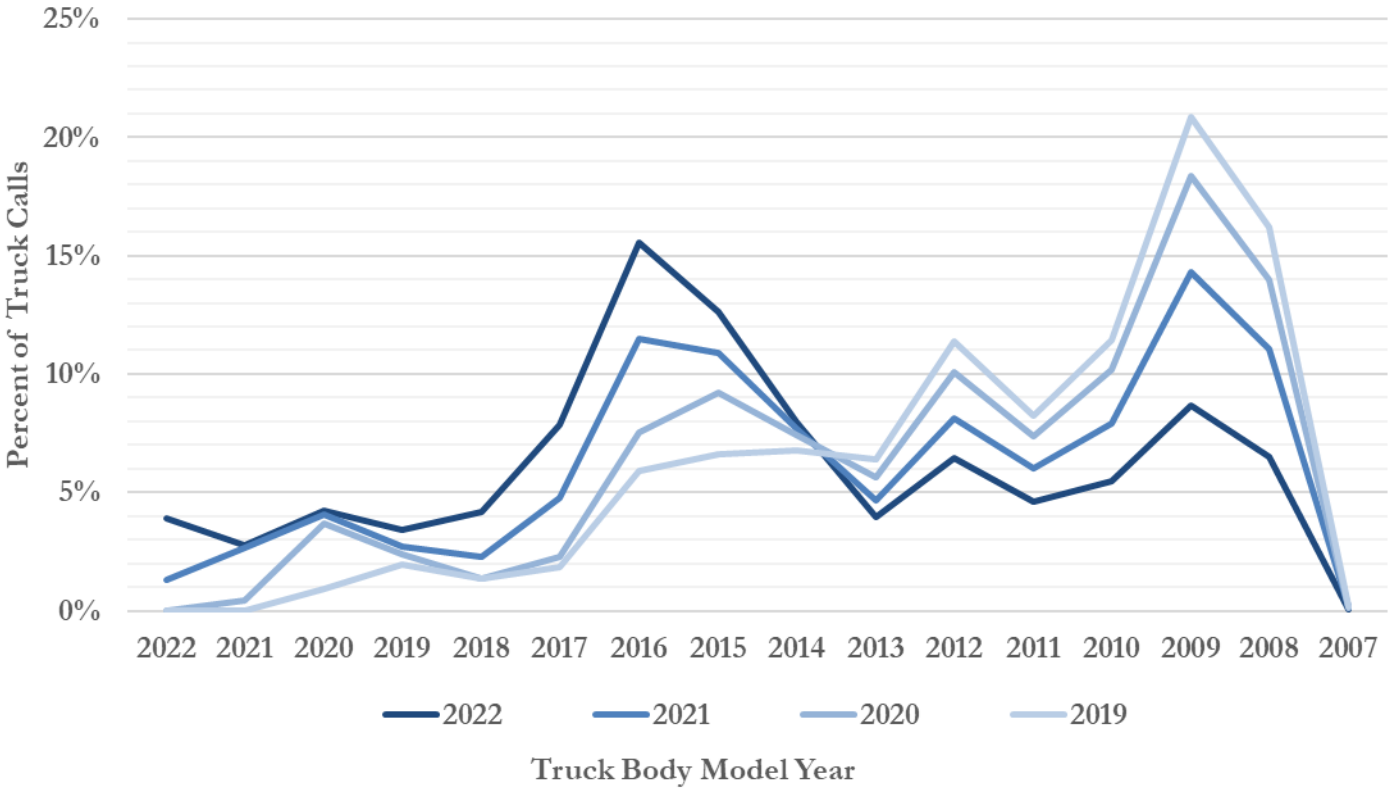
Table 8.22 presents the call-weighted age of the truck fleet. Compared to 2005, the average age of trucks visiting the Port has decreased from 11 to 7 years due to the Port's Clean Trucks Program launched in October 2008 requiring the progressive ban of pre-2007 trucks after 2008 and the most recent requirement that newly registered trucks, as of 2018, must be model year 2014 or newer.

Table 8.22: Call-Weighted HDV Age

Calendar Year	Call-Weighted Average Age (years)	Truck calls 2014 & newer (%)
2005	11.2	0%
2021	7.8	48%
2022	7.4	64%

Figure 8.2 illustrates the HDV model year distribution for calendar years 2019 to 2022. It shows model year 2016 trucks have become dominant for the first time replacing 2009 MY that was dominant in previous years but was declining in number.

Figure 8.2: HDV Model Year Distribution



SECTION 9 METRICS

To measure the effectiveness of emissions reduction strategies and progress towards the San Pedro Bay Emission Reduction Standards, the Port has established metrics to track emissions per unit of work by source category. Since port operations are varied with a mix of container and non-container cargo, the metrics listed in this section are based on TEU throughput and metric tons of cargo moved through the Port. Table 9.1 compares the amount of throughput in 2022, previous year and 2005 in TEU. The TEU throughput in 2022 was the second highest in the Port's history.

Table 9.1: Container and Cargo Throughput and Change, %

Year	Throughput Container (TEU)
2005	6,709,818
2021	9,384,368
2022	9,133,657
CAAP Progress	**36%**
Previous Year	**-3%**

Tables 9.2 shows the port-wide tons of emissions per 10,000 TEU in 2005, 2021 and 2022. The tons of emissions per 10,000 TEU of cargo decreased, an improvement in 2022 from 2005 and 2021.

Table 9.2: Emission Efficiency Metric Comparison, annual tons per 10,000 TEU

Year	PM_{10}	$PM_{2.5}$	DPM	NO_x	SO_x	CO	HC	CO_2e
2005	1.76	1.48	1.36	22.45	10.40	4.20	1.11	1,457
2021	0.18	0.17	0.12	8.19	0.27	2.30	0.38	1,224
2022	0.14	0.13	0.09	6.06	0.21	2.19	0.29	1,058
CAAP Progress	**-92%**	**-92%**	**-93%**	**-73%**	**-98%**	**-48%**	**-74%**	**-27%**
Previous Year	**-25%**	**-25%**	**-26%**	**-26%**	**-22%**	**-4%**	**-23%**	**-13%**

SECTION 10 CAAP PROGRESS

The Port's annual emissions inventories serve as the primary tool to track progress towards achieving the Clean Air Action Plan's San Pedro Bay Standards. These standards consist of the following emission reduction goals:

- Mass Emissions Reduction Standards:
  - By 2014, reduce emissions by 72% for DPM, 22% for NO_x, and 93% for SO_x from 2005 levels
  - By 2023, reduce emissions by 77% for DPM, 59% for NO_x, and 93% for SO_x from 2005 levels

The reduction of goods movement-related emissions in 2022 compared to 2005 can be attributed to a number of initiatives, including emissions reduction programs identified in the CAAP and implemented by the Port, such as the Clean Trucks Program, Green Flag Vessel Speed Reduction Program, as well as CARB regulations requiring the use of shore power for vessels at berth and the use of cleaner vessel fuels.

Economic forecasts indicate cargo volumes through the Port of Long Beach will increase in upcoming years. While emission reductions are expected to continue in the future toward meeting the CAAP goals, the rapid rate of emission reductions in recent years may not continue as cargo volumes increase. However, continued implementation of the CAAP and regulatory programs will continue to provide emissions benefits from goods movement-related sources and may offset impacts from the projected growth in trade.

The mass emissions reduction standards are represented as a percentage reduction of emissions from 2005 levels. Table 10.1 summarizes the standardized estimates of emissions by source category for calendar years 2005 and 2022 using the 2022 methodology. In 2022, the Port met and exceeded the CAAP 2023 DPM, NO_x, and SO_x emission reduction standards.

Table 10.1: 2005-2022 Emissions in tons and Reductions in % Compared to CAAP San Pedro Bay Emissions Reduction Standards

Category	2005	2022
DPM (tons)		
Ocean-going vessels	595	45
Harbor craft	36	7
Cargo handling equipment	33	8
Locomotives	43	19
Heavy-duty vehicles	205	5
Total	**912**	**84**
Cumulative DPM Emissions Reduction Achieved in 2022		**91%**
CAAP San Pedro Bay DPM Emissions Reduction Standards	**2023**	**77%**
NO_x (tons)		
Ocean-going vessels	6,655	3,738
Harbor craft	699	317
Cargo handling equipment	1,165	248
Locomotives	1,273	508
Heavy-duty vehicles	5,273	725
Total	**15,064**	**5,535**
Cumulative NO_x Emissions Reduction Achieved in 2022		**63%**
CAAP San Pedro Bay NO_x Emissions Reduction Standards	**2023**	**59%**
SO_x (tons)		
Ocean-going vessels	6,848	185
Harbor craft	3	0
Cargo handling equipment	11	2
Locomotives	76	0
Heavy-duty vehicles	37	4
Total	**6,975**	**192**
Cumulative SO_x Emissions Reduction Achieved in 2022		**97%**
CAAP San Pedro Bay SO_x Emissions Reduction Standards	**2023**	**93%**

APPENDIX A:
REGULATORY AND SAN PEDRO BAY PORTS CLEAN AIR ACTION PLAN (CAAP) MEASURES

APPENDIX A: REGULATORY AND SAN PEDRO BAY PORTS CLEAN AIR ACTION PLAN (CAAP) MEASURES

This appendix summarizes the current regulatory initiatives and Port measures related to port activity that influenced calendar year 2022 emissions. Almost all goods movement-related emissions in and around the port come from five emission source categories: OGVs, HDVs, CHE, harbor craft, and locomotives. The responsibility for the regulation of emissions of most of these sources falls under the jurisdiction of local (South Coast Air Quality Management District [South Coast AQMD]), state (CARB), or federal (U.S. Environmental Protection Agency [EPA]) agencies.

Clean Air Action Plan (CAAP) Strategies

The CAAP 2017 Update[1] contains strategies from all sources that move cargo through the ports, including the deployment of zero and near-zero emission trucks and cargo handling equipment, and the expansion of programs that reduce ship emissions. The focus of the Update is to work in collaboration with industry stakeholders, regulatory agencies, local communities, and environmental groups to reduce emissions and combat climate change. The CAAP 2017 strategies that affect emission reductions for the Ports include:

- Advancing the Clean Trucks Program to phase out older trucks and transition to near-zero emissions in the early years and zero-emissions by 2035. Under this program, the boards of harbor commissioners of the City of Long Beach and the City of Los Angeles adopted the Clean Truck Fund Rate of $10 per loaded TEU moved by truck in and out of port terminals. There are certain exemptions for use of low NO_x and zero emissions trucks. Collection of the CTF rate began on April 1, 2022. Currently, Port staff are working on strategies to implement the Clean Truck Fund rates and develop priorities and guidance for distributing funds to incentivize transition to near-zero and zero-emission trucks.
- Requiring terminal operators to purchase zero-emissions equipment if feasible, or near-zero or cleanest available when procuring new equipment.
- Further reducing emissions from ships at-berth, and transitioning the oldest, most polluting ships out of the San Pedro Bay fleet.
- Accelerating the deployment of cleaner engines and operational strategies to reduce harbor craft emissions.
- Expanding use of on-dock rail to shift more cargo leaving the port to go by rail.

San Pedro Bay Emissions Reduction Standards

The 2017 CAAP Update did not alter the 2010 CAAP Update goals that set health risk and emission reduction standards but did incorporate two new emission targets to reduce GHGs from port-related sources as described below.

Health Risk Reduction Standard

To complement the CARB's Air Pollution Reduction Programs including the Diesel Risk Reduction Plan, the Ports of Long Beach and Los Angeles have developed the following standard for reducing overall goods movement-related health risk impacts, relative to 2005 emissions level:

- By 2020, reduce the population-weighted cancer risk attributed to port-related DPM pollution by 85% in highly impacted communities located proximate to port sources and throughout the residential areas in the port region.

Emission Reduction Standard

Consistent with the ports' commitment to meet their fair-share of mass emission reductions of air pollutants, the Ports of Long Beach and Los Angeles developed the following standards for reducing air pollutant emissions from goods movement-related activities, relative to 2005 emission levels:

- By 2023, reduce emissions of NO_x by 59%, of SO_x by 93%, and of DPM by 77% to support attainment of the national and federal 8-hour ozone standards and national fine particulate matter ($PM_{2.5}$) standards.

2017 CAAP Update New Emission Reduction Targets

- Reduce GHGs from port-related sources to 40% below 1990 levels by 2030
- Reduce GHGs from port-related sources to 80% below 1990 levels by 2050

Regulatory Programs by Source Category

The following tables summarize current regulatory programs and CAAP measures by major source category that influenced 2021 emissions from goods movement-related operations at the Port and/or will impact emissions in the near future.

Table A.1: OGV Emission Regulations, Standards and Policies

Agency	Regulation/Standard/Policy	Targeted Pollutants	Implementation Year	Impact
IMO	**NO_x Emission Standard for Marine Engines** *www.imo.org/en/OurWork/Environment/Pages/Nitrogen-oxides-(NOx)-%E2%80%93-Regulation-13.aspx*	NO_x	2011 – Tier 2 2016 – Tier 3 for ECA only	Sets NO_x emission standard for auxiliary and propulsion engines over 130 kW output power on newly built vessels
IMO	**Low Sulfur Fuel Requirements for Marine Engines** *www.imo.org/en/OurWork/Environment/Pages/Sulphur-oxides-(SOx)-%E2%80%93-Regulation-14.aspx*	DPM PM SO_x	2012 ECA – 1% Sulfur 2015 ECA – 0.1% Sulfur	Significantly reduces emissions due to low sulfur content in fuel by creating Emissions Control Area (ECA)
IMO	**Energy Efficiency Design Index (EEDI) and Energy Efficiency Existing Ship Index (EEXI) – MEPC 333 (76)** *www.imo.org/en/OurWork/Environment/PollutionPrevention/AirPollution/Pages/Technical-and-Operational-Measures.aspx*	CO_2 and other pollutants	2013 – EEDI 2023 - EEXI	Increases the design efficiencies of ships relating to energy and emissions
IMO	**2023 IMO Strategy on reduction of GHG emissions from ships – MEPC 377 (80)** *wwwcdn.imo.org/localresources/en/MediaCentre/PressBriefings/Documents/Clean%20version%20of%20Annex%201.pdf*	CO_2	2050 – 100%	Phase out GHG completely by 2050 from 2008 level. Intermediate GHG reduction checkpoints in 2030 and 2040.
IMO	**Carbon Intensity Indicator (CII) - MEPC 328 (76)**	CO_2	2030 – 40% reduction from 2008 baseline	Increases the transport work efficiency of ships relating to emissions; reduce the carbon intensity of all ships.

Table A.1 (continued): OGV Emission Regulations, Standards and Policies

Agency	Regulation, Standard, or Policy	Targeted Pollutants	Implementation Year	Impact
EPA	**Emission Standards for Marine Diesel Engines above 30 Liters per Cylinder (Category 3 Engines);** *www.epa.gov/regulations-emissions-vehicles-and-engines/domestic-regulations-emissions-marine-compression*	DPM PM NO_x SO_x	2011 – Tier 2 2016 – Tier 3	Auxiliary and propulsion on US-Flagged new built vessels; Use of low sulfur fuel
CARB	**Regulation to Reduce Emissions from Diesel Auxiliary Engines on Ocean-Going Vessels While At-Berth at a California Port**	All	2014 – 50% 2017 –70% 2020 – 80%	Vessels must use Shore power (or equivalent) requirement to reduce at-berth emissions. Compliance levels based on fleet percentage visiting the port.
CARB	**New 2020 At-Berth Regulation** *ww2.arb.ca.gov/our-work/programs/ocean-going-vessels-berth-regulation*	All	2023 – 100% container, reefer, and cruise 2025 – Ro-Ro and tankers	All container, reefer, cruise, Ro-Ro, and tanker vessel and regulated terminal operator will have an obligation to meet the requirements
CARB	**Ocean-going Ship Onboard Incineration** *www.arb.ca.gov/ports/shipincin/shipincin.htm*	DPM PM HC	2007	Vessels operators cannot incinerate within 3 nm of the California coast
SPBP CAAP	**CAAP Measure – OGV 1 Vessel Speed Reduction (VSR) Program** *www.cleanairactionplan.org/strategies/ships/*	All	2008	Vessel operators within 20 nm and 40 nm of Point Fermin
SPBP CAAP	**CAAP Measure – OGV 2 Reduction of At-Berth OGV Emissions** *www.cleanairactionplan.org/strategies/ships/*	All	2014	Shore power requirements. Vessel operators and terminals
SPBP CAAP	**CAAP Measure – OGV 5 and 6 Cleaner OGV Engines and OGV Engine Emissions Reduction Technology Improvements**	DPM PM NO_x	2012	Vessel operators who choose to participate in technology
